In this example,  $|S|=15$ . In order to figure out how to pack the samples into tracks, we create a set  $T$  of track links, and assign each sample to the track which contains it. In this case,  $|T|=\frac{15}{2}=7.5$ . Then, for each track, we walk through all its samples and create a list of the corresponding track links. Note that the order of the samples is not important because the goal is to construct a sequential packing. Now, we compare the samples between themselves and store each sample that is  $1$  sample larger than the sample on its left in a list, as shown in Figure [\\[fig:track\\\_packing\\\_example\\]](#). A sample larger than the sample on its left is called \*a head\* of the track. The list is called \*a track\*. In this case, the head  $A$  and the track  $B$  are stored in the list. A head can be larger than another one.

OEBS Enterprise Manager. OEBS ORacle Enterprise Manager. OEBS OEB SAuthenticator. OEBS OEBSAuthenticator. Installing OEBS. In the Install Applications window, specify the installation directory. You can either use the default settings or specify your installation directory. In the Name field, enter a name for the installation directory. It is recommended to use a unique name. In the "Folder" field, enter the path to the folder (default is "E:\") on your hard drive where the installation files are stored. If the folder is publicly accessible, you must enter a user name and password to access it. Otherwise, the installer will not be able to recognize the folder. In the "User folder" field, enter the user name (by default "Administrator") with which you want to install the program. In the "Password" field, enter a password. If no password is set, the default is "admin". fffad4f19a
