Nor, does any ground for reversal of a verdict or judgment appear unless the reviewing court is satisfied that the error was of such prejudicial character that the failure to reverse would be a manifest denial of justice. Jackson v. State, 230 Md. 562, 187 A.2d 880; Henderson v. State, 1 Md. App. 401, 430. The purpose of the statute is to see that when a defendant is convicted of multiple offenses arising from the same criminal act or transaction, he is not subjected to multiple convictions and sentences for the same act or transaction. State v. Oliver, supra. The offenses are not the same merely because they involve but one injury. Kramer v. State, supra. The judgment in this case is affirmed, and it is so ordered. Q: Check database value is null I have a table called "userinfo" in my database and it has two columns first is "user_id" which is the user id which is an int and then is "user_pass" which is a password. I am setting them in a text box like this txpass.Text = (databaseTable.user_pass == DBNull.Value? "" : databaseTable.user_pass).ToString(); My question is how do I make this check to see if the database has a value or it is null so that I don't make a bad query Here is the error I am getting Object reference not set to an instance of an object A: You are getting that error because you are not checking whether the user_pass string is null, you are checking the object itself. You should change your code to: string userPass = (databaseTable.user_pass == DBNull.Value? "" : databaseTable.user_pass).ToString(); txpass.Text = (userPass == ""? "" : userPass); This will check whether the userPass string is empty or not. If it is empty, then the object is null. If it isn't empty, then
