Oct 21, 2019 . -and-3d-gayvilla-2-full-version-crack-download-software-download-make-a-bootleg-of-it-miami-dade-florida-united-states-39. 3d gayvilla 2 full version crackConventionally, in a magnetic tape storage apparatus such as a magnetic tape storage system, when an objective tape cartridge is loaded in the apparatus, there is a need for positioning a recording head of the apparatus in the vicinity of the reel of the loaded tape cartridge. To fulfill the need, a positioning mechanism is generally provided in the apparatus. The positioning mechanism provided in the magnetic tape storage apparatus includes a reel table, a reel driving unit, and a tape loading mechanism. The reel table is rotatably driven by the reel driving unit, and rotates together with the reel. The reel table has an elevation mechanism such as a link mechanism and an elevating cam, and can thus move up and down. The elevating cam has a first end portion abutting against a tip of the reel in the unloaded state, and a second end portion against which the tip of the reel abuts in the loaded state. The reel driving unit rotates the reel table, and therefore the elevating cam. The elevating cam drives the link mechanism, and as a result, the reel table is raised or lowered. When the magnetic tape cartridge is loaded in the magnetic tape storage apparatus, the tape loading mechanism, which includes a tape reel take-up member and a tape guide member, moves the reel to an access position. This movement brings the tip of the reel into contact with the second end portion of the elevating cam. Accordingly, the reel table is raised by the elevating cam. The magnetic tape cartridge has a protrusion at the back of the cartridge. When the magnetic tape cartridge is loaded in the magnetic tape storage apparatus, the tape loading mechanism detects the protrusion and starts its movement. The protrusion thus serves as a trigger for the tape loading mechanism. The tape loading mechanism stops its movement when the tape protrusion is detected, and waits for a command from the reel driving unit to start the movement again. The movement of the tape loading mechanism after the protrusion detection is important to prevent the reel table from moving in an unloading direction before loading is completed. That is, when the tape protrusion is not detected by the tape loading mechanism 2d92ce491b
