Why this Ask Question • what the question is asking about? • what the question is NOT asking about? • what is being asked here? It has been known to produce beverages of one or more flavors by combining a flavoring liquid with water to form a dilute beverage syrup, and then diluting this syrup with a predetermined amount of water to form a beverage. Because the beverage may be produced by mixing flavored water with a base syrup, the beverage does not taste bitter and does not give the perception of having a “flat” taste. In the case of coffee, for example, a flavored water may be formed by adding coffee flavoring to water. Because of the fact that there is a high flavor concentration in the flavored water, the beverage produced from this flavored water is referred to as a “concentrated coffee.” On the other hand, if the flavored water is mixed with a base syrup of a particular flavor, the beverage produced from this mixture is referred to as a “non-concentrated coffee.” Since the flavored water and the base syrup have a lower concentration of flavoring, the flavor is less concentrated in the beverage, and the beverage does not taste bitter. In such beverages, the aroma of the coffee, the flavor of the beverage, and the mouth feel are enhanced. For example, if the flavored water and the base syrup are mixed, the flavoring concentration is decreased, so the coffee aroma is not diluted, the coffee flavor is not “flat,” and the mouth feel is not diluted. In addition, the mixed beverage has the effect of suppressing “coffee sedimentation” in the case where a non-concentrated coffee is left to stand for a certain period of time, as coffee sedimentation is caused by the water component in coffee. the key. So the following code prints 5

```
int h = 0; int x = 5; std::vector v{1, 2, 3, 4, 5}; std::vector<P> P(2); P[0] = {std::make_pair(x, h), std::make_pair(x, h)}; P[1] = {std::make_pair(x, h), std::make_pair(x, h + 1)}; for (const auto &p : P) { std::
