Rufus is a utility that helps format and create bootable USB flash drives, such as USB keys or pen drives, memory sticks, etc. It can be especially useful for creating bootable Windows and Linux USB installers. The latest version can be downloaded from the official site.

Rufus is a small utility that helps format and create bootable USB flash drives, such as USB keys or pendrives, memory sticks, etc. It can be especially useful for creating bootable Windows and Linux USB installers. The latest version can be downloaded from the official site. Rufus 1.3.2.232 · Full download · english · Windows 7 · 64-bits · 1.34MB. (2.4GB of total downloads). If you are looking

---

for a program that helps you to create bootable USB drives on the Windows 7, or you can use the Rufus (for Windows 8.1, Rufus 1.3.2.232) free from the official site.

### Rufus.1. Field of the Invention

The present invention relates to security systems for electronic communications. More particularly, the present invention relates to a method and apparatus for providing secure communications between a host computer and a remote terminal by hiding the remote terminal as a conventional peripheral device.

### 2. Art Background

In the past, computer security has been a problem for both the users and the vendors of computer systems. The problem

---

was made more pronounced by the growing use of the Internet as a communication mechanism. In a world wide network, one may communicate with a host computer, anywhere in the world, over a telephone line. Since the computers are not physically attached to each other, they were vulnerable to viruses and other malicious programs. Also, if a user communicated over an unsecured telephone line, the information was also vulnerable. Most computer systems operate with a local area network (LAN) and/or a wide area network (WAN). A LAN is a network of computers within a small geographic area. Computers within the LAN share information,

---

and provide a functional interface between local peripheral devices and the computer. For example, the computers within a LAN may be used to share information using a file server and/or an application server. A WAN is a network of computers across a large geographic area. The computers within the WAN may exchange data using a communications server.

Communication between computers within the LAN and computers within the WAN is facilitated by a number of communication mediums 2d92ce491b
