? Your "keywords" are the exact search criteria you want your files to be matched to. KEYMACRO allows you to customize searches by choosing keywords from a list of up to 20 search criteria, including the time frame you wish to search, the type of file to search, and the search location. Your keywords are automatically generated. Each keyword has a "match time" assigned to it. The match time tells you how long the keyword should remain in your search criteria in order to be detected. After this time expires, the keyword is removed from the criteria and you can add another keyword if you wish. Your keywords are only used to help you find your way back to files when searching your collection. They are not used to keep track of files once you've found them. Main Features: ? ## SpoonFTP

SpoonFTP is a free FTP server and client utility that lets you transfer files using the File Transfer Protocol (FTP). This allows you to both send and receive files from a variety of FTP clients running on different operating systems, including Windows, BeOS, MacOS, OS/2, and UNIX. SpoonFTP should be installed on your server, and any other client software should point to that server.

What's New in Version 1.2.3:

- ? Option to turn on and off logging
- ? Folders can now be renamed by long name, which will remove the need for spaces. Previously, only short names could be used.
- ? "Quit" command in the context menu now correctly cancels SpoonFTP running as a service.
- ? Root file tree is now fully recursive
- ? Logging can now be enabled on a folder-by-folder basis. Previously, only the default log folder was configured to log.
- ? Default log level can now be set to log all log messages or just errors.
- ? Configuration can now be saved to the registry or written to a file for future reinstallation.
- ? Configuration now uses Windows LUA.
- ? Cleanup code fixes the problem where Windows 98 defaulted to Windows 2000 when it found SPOONFTP.INI missing from the system.
