.Naturally occurring antibodies isolated by phage display are capable of specifically detecting and quantifying soluble proteins in protein mixtures. Many laboratories have explored the use of phage display technology for protein detection and quantification. Most reports to date have used display of single protein domains, not the full-length antibody. One caveat to using antibody domains, however, is the risk of steric hinderance, as it has been shown that the relative efficacy of phage selection against competitors can depend on the accessible surface area of the displayed protein. This steric constraint may limit the utility of the technology for developing antibodies capable of detecting proteins in complex mixtures. Here we show that naturally occurring antibodies can be displayed on the phage surface, resulting in specific selection of well-folded, soluble proteins. Antibodies produced by our display system can bind, in solution, to at least five proteins present in a mixture of proteins, and in some cases it was possible to distinguish the proteins with different binding levels. Our results demonstrate the potential of this technology for the development of antibodies capable of detecting specific proteins in complex biological mixtures.Q: Can I use my years of experience as a Physics Graduand in industry for transfer? I recently applied for a Software Engineer Program at a company that claims they focus on

I am reading this paper: Physics and nature of the magnetoelectric effect in skutterudite compound $Mg_3V_4S_8$ And I have two questions. First, on the page 2 in the picture, a spin operator is introduced: $\sigma_{j^{\prime}} = \sum \lim_{j^{\prime}} C_{j,j^{\prime}}(c_{j^{\prime}}^{\dagger} c_j - c_j^{\dagger} c_{j^{\prime}})$ The index j is defined as $\{j,j^{\prime}\} = \{j_x, j_y, j_z\} \equiv \{k,k^{\prime}, \sigma\}$. Where $C_{j,j^{\prime}}$ is the spherical component of the Clebsch-Gordan coefficient, $j=k^{\prime}$ and j 570a42141b
